**SPHINX HP**

The Honeypot dashboard makes it easy for SPHINX admins to view information of the HP (honeypot) instances that are running in the SPHINX network. Users can select the view information about a specific HP by selecting the appropriate HP name from the dropdown list of the top left corner of the SPHINX-Honeypot ID.

In the Honeypot Dashboard we can see all the useful info for the device and the Honeypot Services. In the right pane of the page, we can see the specifications of the device that the Honeypot resides as well as statistics about the CPU, Memory and Network Traffic. When selecting an existing HP in the top left of the page, important info about the Honeypot services will appear, such as the total service hits (SSH, HTTP, SMTP, FTP).

In the mid-left of the page a map exists where the approximate location of every attacker's IP is visualized in order to help the end user understand the origin of an attack.
